CLINICAL MANAGEMENT PROTOCOLS
FOR THE MOST COMMON HEALTH CONDITIONS
IN PRIMARY HEALTH CARE
This guidebook has been produced with the support of the European Union and printed by the World Health Organization in partnership with the United Nations High Commissioner for Refugees in the context of a project led by the Ministry of Public Health. The content of this guidebook is the sole responsibility of the Ministry of Public Health and can in no way be taken to reflect the views of the European Union.
ACKNOWLEDGMENTS

This guidebook has been prepared by the Lebanese Society of Family Medicine under the guidance of WHO Lebanon Country office team, with the overall supervision of the MOPH team.

Special acknowledgement goes to the Director General of the MOPH Dr Walid Ammar for his guidance throughout the development process. A special thanks for the MOPH team, particularly the Head of the PHC Department Mrs Randa Hmadeh, for facilitating the development process.

Particular thanks for the support provided by the National Professional Officer at WHO CO Lebanon Dr Alissar Rady, for the technical input and the coordination of the overall development process, as well as to the Public Health Officer at WHO CO Lebanon Ms. Edwina Zoghbi, for editing and following up with the Lebanese Society of Family Medicine on the daily issues related to the development process.

Final acknowledgement goes to the Acting WHO Representative Dr Gabriele Riedner, for her unconditional support throughout the development process.
V. OBESITY
Antoine Aoun, MD

EPIDEMIOLOGY

1. It is a substantial public health crisis with the prevalence increasing rapidly worldwide.
2. The prevalence of obesity in Lebanon is around 28%, according to study conducted on a representative sample of 3500 participants in 2012.

DEFINITION

1. Defined as abnormal or excessive fat accumulation that may impair health.
CAUSES

1. Hypothyroidism.
2. Cushing’s Syndrome.
3. Insulinoma.
4. Hypothalamic obesity.
5. Polycystic ovary syndrome.
6. Family history.
7. G syndromes such as Parer Willi, Alstrooms, Bardet Biedl, Cohens, Borjeson Forsmsman Lehmann and Frolich’s syndrome.
8. Growth hormone deficiency.
9. Medication related: including phenothiazines, sodium valproate, carbamazepine, tricyclic antidepressants, lithium, glucocorticoids, megestrol acetate, the thiazolidinediones, the sulphonylureas, insulin, adrenergic antagonists, serotonin antagonists, and oral contraceptives.
11. Hypogonadism.
13. Environmental: sedentary behaviors, culture and dietary habits etc. e.g., television-video-computer games, consumption of sweetened soft drinks.

DIAGNOSIS

1. Body Mass Index (BMI) is calculated as Weight in kg/Height in m². Commonly used to classify obesity as:
   a. Grade 1 overweight (commonly called overweight) - BMI of 25-29.9 kg/m²
   b. Grade 2 overweight (commonly called obesity) - BMI of 30-39.9 kg/m²
   c. Grade 3 overweight (commonly called severe or morbid obesity) - BMI ≥ 40 kg/m²
2. Waist circumference: considered high, in the Middle Eastern region, if above 94 cm in men and 80 cm in women.
3. Waist to hip ratio above 0.90 for males and 0.85 for females reflects central obesity characterized by an “android” or “apple” shape. It is more common in men and considered a strong risk factor for several diseases, whereas the “gynoid” or “pear” shaped obesity is more frequent in women.

CO-MORBIDITIES

1. Respiratory: obstructive sleep apnea, greater predisposition to respiratory infections, increased incidence of bronchial asthma, and Piokwickian syndrome (obesity hypoventilation syndrome).
3. Psychological: social stigmatization and depression.
4. Cardiovascular: coronary artery disease, essential hypertension, left ventricular hypertrophy, cor pulmonale, obesity-associated cardiomyopathy, accelerated atherosclerosis, and pulmonary hypertension of obesity.
7. Surgical: Increased surgical risk and postoperative complications, including wound infection, postoperative pneumonia, deep venous thrombosis, and pulmonary embolism.
9. Gastrointestinal: gall bladder disease (cholecystitis, cholelithiasis), nonalcoholic steatohepatitis (NASH), fatty liver infiltration, and reflux esophagitis.
12. Reproductive:
   a. in women: anovulation, early puberty, infertility, hyperandrogenism, and polycystic ovaries
   b. in men: hypogonadotropic hypogonadism
13. Cutaneous: intertrigo (bacterial and/or fungal), acanthosis nigricans, hirsutism, and increased risk for cellulitis and caruncles.
14. Extremity: venous varicosities, lower extremity venous and/or lymphatic edema.
15. Miscellaneous: reduced mobility and difficulty maintaining personal hygiene.
PHYSICAL EXAMINATION

1. Anthropometric measurements: height, weight, waist and hip circumference.
2. Skin: intertriginous rashes reflects skin friction; hirsutism in women, acanthosis nigricans, and skin tags are common with insulin resistance state.
3. Neck: goiter may denote thyroid abnormalities.
4. Abdomen: tender large liver may suggest hepatic fatty infiltration or NASH (non alcoholic steatohepatitis) and pink broad striae that suggest cortisol excess.
5. Extremities: joint deformities (e.g. coxa vara), crepitations suggestive of osteoarthritis, pressure ulcers. Localized and lipodystrophic fat distribution should also be identified, because of their common association with insulin resistance.

LABORATORY TESTING

1. Fasting lipid panel.
2. Liver function studies.
3. Thyroid function tests.
4. Fasting glucose and hemoglobin A1c (HbA1c).
5. Insulin level is not recommended.

MANAGEMENT (please check algorithm 2.V.1)

1. Highlight the relationship between eating behavior and stressors.
2. Consistent low-calorie and small portion eating patterns.
3. Avoid skipping meals especially breakfast.
4. Weigh once/week.
5. 1 hour physical activity/day and less than 10 hours television (TV) per week.
6. Family support and involvement.

Clinical Practice Recommendations for management of obesity are included in table 2.V.1.

</table>
8. Consider offering obese patients comprehensive lifestyle intervention for weight loss to reduce harms of degenerative joint disease.

**General Treatment Principles of Weight Loss**

9. Offer patients at least 12 contacts within 12 months of a comprehensive lifestyle intervention that combines dietary, physical activity and behavioral strategies.

10. Plan a net deficit of 500 to 1,000 kcal/day addressing both diet and physical activity to achieve a weight loss of 0.3-1 kg per week, resulting in a 5-10% reduction in body weight over 6 months.

11. Offer patients who have met their weight loss goals a comprehensive maintenance program consisting of behavioral components and ongoing support.

**Behavioral and Lifestyle Approaches**

12. Offer comprehensive lifestyle interventions for weight loss, in either individual or group setting.

13. Offer telephone-based comprehensive lifestyle intervention for weight loss, either as an alternative or an adjunct to face-to-face intervention.

14. There is insufficient evidence for or against offering internet-based comprehensive lifestyle intervention for weight loss, as an alternate or adjunct to face-to-face intervention.

**Dietary Approaches**

15. Offer any of several diets that produce a caloric deficit and have evidence for weight loss efficacy and safety (e.g., low-carbohydrate, Dietary Approaches to Stop Hypertension (DASH), low-fat).

16. Offer very-low-calorie diets for weight loss, but only for short durations (12-16 weeks) and under close medical supervision.

17. Offer meal replacements to achieve low-calorie or very low-calorie diets.

**Physical Activity Approaches**

18. Offer physical activity options that include short intermittent bursts (at least 10 minutes) as well as longer continuous exercise.

19. Offer, as part of a comprehensive lifestyle intervention, moderate-intensity physical activity performed for at least 150 minutes/week to result in weight loss.

**Pharmacotherapy**

20. Offer pharmacotherapy with the combination phentermine/topiramate extended-release to patients with a BMI ≥ 30 kg/m² and to those with a BMI ≥ 27 kg/m² who also have obesity-associated conditions, as an adjunct to comprehensive lifestyle intervention, when lifestyle interventions alone do not produce the desired weight loss.

21. Offer pharmacotherapy with orlistat or lorcaserin to patients with a BMI ≥ 30 kg/m² and to those with a BMI ≥ 27 kg/m² who also have obesity-associated conditions, as an adjunct to comprehensive lifestyle intervention, when lifestyle interventions alone do not produce the desired weight loss.

22. Offer patients who achieve their weight loss goal a program that includes continued use of medication for weight maintenance.

**Bariatric Surgery**

23. Offer bariatric surgery, as an adjunct to comprehensive lifestyle intervention, for weight loss in adult patients with a BMI > 40 kg/m² or those with BMI 35.0-39.9 kg/m² with one or more obesity-associated conditions.

**MEDICATIONS**

Currently, the major drugs approved by the FDA and used to manage obesity are included in table 2.V.2:
### TABLE 2.V.2: RECOMMENDED DOSES FOR OBESITY PHARMACOTHERAPY

<table>
<thead>
<tr>
<th>Drug</th>
<th>Recommended Dosage and Administration</th>
<th>Contraindications and Cautions</th>
</tr>
</thead>
</table>
| Orlistat 120 mg capsule | 120 mg, three times a day  
- Taken with or within 1 hour of each meal containing fat  
- Take daily multivitamin (containing fat soluble vitamins A, D, E, and K at least two hours prior to orlistat) | - Contraindicated during pregnancy (FDA category X)  
- Not recommended for mothers who are nursing  
- Increased gastrointestinal adverse effects when taken with diets high in fat                                                                                     |
| [Gastrointestinal lipaselnhibitor] |                                                                                                           |                                                                                                                                                                                                                             |
| Lorcasarin 10 mg tablet | 10 mg two times a day  
- Maximum 20 mg/day  
- May be taken without regard to food  
- Consider stopping after 12 weeks if lorcasarin has not been effective in reducing weight more than 5% of initial body weight | - Contraindicated during pregnancy (FDA category X)  
- Not recommended for mothers who are breastfeeding  
- Use with caution in patients with valvular heart disease, bradycardia, congestive heart failure, or those using serotonergic or antidopaminergic drugs  
- Potential for cognitive impairment and psychiatric reactions including sedation, euphoria and suicidal thoughts  
- Potential risk of hypoglycemia in patients being treated for diabetes, anemia, neutropenia, hyperprolactinemia |
| [Serotonin receptor agonist] |                                                                                                                                                                      |                                                                                                                |
| Phentermine / topiramate 3.75 mg/23 mg, 7.5 mg/46 mg, 11.25 mg/69 mg, 15 mg/92 mg Extended-release capsules (ER caps) | Dose Titration  
- One 3.75 mg/23 mg ER cap each morning for 14 days; then increase to 7.5 mg/46 mg each morning for an additional 12 weeks.  
- If a weight loss of 3% of baseline body weight is not achieved discontinue or increase the dose to 11.25 mg/69 mg each morning for 14 days; then increased to 15 mg/92 mg (maximum dose) daily.  
- If after 12 weeks on 15 mg/92 mg the patient has not lost at least 5% of baseline body weight, discontinue treatment using every other day weaning over one week thereby decreasing risk of seizure | - Contraindicated during pregnancy (FDA category X) and use not recommended in breastfeeding mothers  
- Avoid use in glaucoma, hyperthyroidism, or within 14 days following use of a MAOI  
- Not recommended in patients with unstable cardiac or cerebrovascular disease  
- Potential for metabolic acidosis, elevated creatinine, hypotension, CNS depression, hypokalemia, kidney stones, withdrawal seizures, and hypoglycemia in patients being treated for diabetes |
| [Appetite suppressant / Anticonvulsant] |                                                                                                                                                                      |                                                                                                                |

### SURGERY

A summary of surgical procedures for obesity treatment is included in table 2.V.3.

### SELECTION CRITERIA:

1. Able to adhere to postoperative care
2. BMI ≥ 40 kg/m²
3. BMI ≥ 35 kg/m² with obesity-related comorbidity
4. Previous failed nonsurgical attempts at weight reduction, including nonprofessional programs
**EXCLUSION CRITERIA:**
1. Cardiopulmonary disease that would make the risk prohibitive
2. Current drug or alcohol abuse
3. Lack of comprehension of risks, benefits, expected outcomes, alternatives, and required lifestyle changes
4. Reversible endocrine or other disorders that can cause obesity
5. Uncontrolled severe psychiatric illness

ALGORITHM 2.V.1: MANAGEMENT OF OBESITY

Screen for overweight and obesity annually. Obtain height, weight and calculate BMI

Is the patient's BMI ≥ 25 kg/m²?

No

Consider providing information and behavioral counseling about healthy diet and physical activity behaviors in order to maintain a healthy weight (Refer to box B)

Yes

Is the patient’s BMI ≥ 30 kg/m²?

No

Are obesity-associated conditions present? (Refer to box A)

No

Overweight patient without obesity-associated conditions

Yes

Overweight patient with one or more obesity-associated conditions

Obese patient

Continue with current treatment plan and/or assess as needed

Has patient met intermediate and long term weight loss goals?

Yes

If patient meets appropriate criteria, consider pharmacotherapy or bariatric surgery as an adjunct therapy

No

Box A: Common Obesity-Associated Conditions
1. Hypertension
2. Type 2 diabetes and prediabetes
3. Dyslipidemia
4. Metabolic syndrome
5. Obstructive sleep apnea
6. Degenerative joint disease
7. Non alcoholic fatty liver disease

Box B: Behavioral Counseling
Healthcare staff-delivered activities to assist patients adopt change or maintain healthy dietary and physical activity behaviors.

Box C: Comprehensive Lifestyle Intervention
An intervention that combines dietary, physical activity and behavioral components, and it includes at least 12 intervention sessions over a 12 month period.

Once patient has met weight loss goals, offer comprehensive maintenance program
